PRETTAU[®] 3 DISPERSIVE[®]

The Zirkonzahn Culture

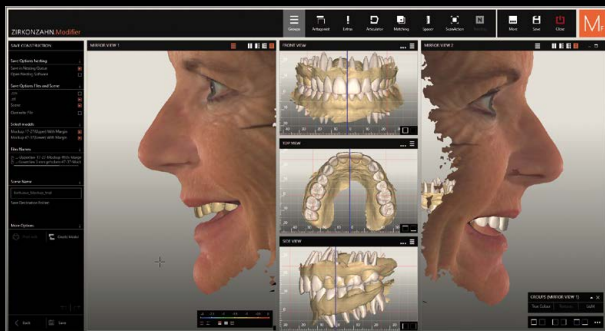

SINGLE MONOLITHIC TEETH MADE OF PRETTAU® 3 DISPERSIVE® ZIRCONIA

Initial situation: patient with abraded teeth, caused by parafunction.

The technician designed 28 final single crowns in the Zirkonzahn.Modellier software on the base of the tooth setup carried out in the Zirkonzahn.Modifier and milled them out of Prettau® 3 Dispersive® zirconia blank. After the speed-sintering in the Zirkonofen Turbo, the crowns were checked on the model, which was printed with the P4000 system for 3D printing.

Once the restoration fit was approved, the single crowns were characterized using the ICE Stains 3D by Enrico Steger, glazed with glazing material, and fired in a single step thanks to the All-In-One Technique. The single crowns were then minimally layered with Fresco Enamel Fluo in the vestibular tooth area and fired once again to lightly individualize the tooth form and achieve a natural-looking surface structure.

The final zirconia crowns are handed over to the dentist and inserted in the patient's mouth. A functional and phonetic check confirmed the treatment's success.

100% MONOLITHIC ONLY MINIMAL AESTHETIC LAYERING

Dr. med. dent. Manrique Fonseca – Bern, Switzerland

NEW! PRETTAU® 3 DISPERSIVE®

- The material is already provided with color, translucency and flexural strength gradients during the manufacturing process
- **Gradual-Triplex-Technology:** triple gradient with natural coloring as well as increasing flexural strength and translucency values
- For reduced or monolithic single crowns, inlays, onlays, veneers and 3-unit bridges (especially suitable for monolithic design)
- No ceramic chipping (thanks to monolithic design), and no abrasion of the antagonist
- Restorations can be characterized individually for each patient with Colour Liquids Prettau® Aquarell Intensive, ICE Ceramics, Fresco Ceramics, ICE Stains Prettau® and ICE Stains 3D by Enrico Steger
